

Introducing WIS2 in a box (wis2box)

Reminder: What is a WIS2 Node?

A WIS2 node is composed of 2 endpoints that need to be exposed over the public internet:

- **MQTT broker**: to publish WIS2 notifications for metadata and data
- **HTTP data server**: to enable the download of data files and metadata records

Global Discovery Catalogues download all valid **WCMP2** records from the HTTP-endpoint for notifications on topic=*origin/a/wis2/+/metadata*

Global Brokers subscribe to topic=*origin/a/wis2/<centre-id>/#* on the WIS2 Node MQTT broker, and republishes all valid WIS2-notifications

Global Caches download data from topic=*origin/a/wis2/+/data/core/#* and republish on topic=*cache/a/wis2/+/data/core/#*

MQTT channel defined by the **WIS2 Topic Hierarchy (WTH)** standard

Discovery Metadata records defined by **WCMP2** standard

MQTT payload defined by the **WIS2 Notification Message (WNM)** standard

What is WIS2 in a box?

- WIS2 in a box (wis2box) is a **Reference Implementation of a WIS2 Node**
- Designed to be **cost-effective** and **low-barrier** to operate*
- Developed as Docker Compose stack using existing **Free and Open Source** software and wis2box-specific components
 - wis2box source code at: <https://github.com/World-Meteorological-Organization/wis2box>
- Developed by WMO together with Canada to **accelerate the WIS2 implementation**
- Currently over 50 WMO-Members are using wis2box to share data on WIS2

*wis2box hosting requirements:

- minimum 2 vCPUs with 4GB Memory and 24GB of local storage
- requires Python, Docker and Docker Compose pre-installed
- HTTP and MQTT ports routed to a publicly accessible address
- See documentation at <https://docs.wis2box.wis.wmo.int>

WIS2 in a box is Free and Open

Free and Open Source Software

Open Standards

- MQTT
- GeoJSON
- OGC APIs

Docker and Docker Compose

wis2box uses Docker and Docker Compose to define a set of services

Using pre-built Docker images to create containers providing a specific service

NOTE: you do not need to be familiar with Docker to run wis2box

Docker and Docker Compose

Why is wis2box composed as a set of Docker containers?

- Docker containers contain all necessary dependencies, libraries, and binaries required to run the service
- Docker containers run on any system with Docker installed, regardless of underlying hardware or operating system
- Docker containers provide process and resource isolation, enhancing security

The Python script 'wis2box-ctl.py' provides a wrapper around Docker Compose commands to interact with wis2box

Software required on the host to run wis2box:

- Python
- Docker
- Docker Compose

WIS2 in a box core services

WIS2 Node core services:

- HTTP storage endpoint (MinIO)
- MQTT broker (mosquitto)
- 'wis2box-management': create WCMP2 records and WIS2 notifications

WIS2 in a box services

wis2box-api (Geospatial Web API)

wis2box-api provides a **Application Programming Interface** (API) within wis2box built using **pygeoapi**: a Free and Open Source project that provides an OGC Reference Implementation of the **OGC API** standards:

- OGC API – Processes to provide additional data processing functionality
- OGC API – Features to datasets/collections stored in backend
- OGC API – Records for WCMP2 records stored in backend

wis2box-api enables users and web-interfaces to **query data items programmatically using a Geospatial Web API**

Summary

wis2box is a Free and Open Source Reference Implementation of a WIS2 Node

- Developers can freely use components used inside of wis2box to adapt existing systems to be WIS 2.0 compliant
- Source code: <https://github.com/World-Meteorological-Organization/wis2box>
- **Feedback by the community is appreciated to help improve wis2box**

wis2box is software not hardware

- To be deployed on a host with Python, Docker and Docker Compose pre-installed
- Documentation: <https://docs.wis2box.wis.wmo.int>
